

## How to locate the Employee.java file in the SymbolBalance exercise

Follow this example: Suppose Employee.java is in the package prog9\_2\_soln. The *prefix* for the path to Employee.java will then be the full path to prog9\_2\_soln. On my computer, that full path is:

```
C:\Data\mum\courses\FPP\FPP-Sept-2021\workspace\LabSols\src\
```

You can obtain this path (as it is on your computer) using the following code:

```
String prefix = System.getProperty("user.dir") + "\\src\\";
```

Then you must give this prefix and the fully qualified name of Employee.java to the Files.readAllLines method in the following way:

```
String filename = "prog9_2_soln\\Employee.java";  
List<String> lines  
    = Files.readAllLines(Paths.get(prefix, filename));
```
